**THE INFLUENCE OF DIET AND SUPPLEMENTS  
ON YOUR DOG'S ARTHRITIS**

## RECEIVING A DIAGNOSIS OF OSTEOARTHRITIS IN YOUR DOG CAN BE DEVASTATING

The degenerative nature of the disease often results in caregivers researching methods of managing the current level of arthritis as well as seeking possible interventions to influence disease progression. An avenue often explored is that of dietary management and joint supplements.

Canine Arthritis Management was created for many reasons, primarily a desire to help

owners by providing them with reliable, effective and safe advice. The founding member of CAM found herself where you are now, when her own dog (Holly the wonder dog) was diagnosed; she set about doing what most owners do, seeking out the best treatments, diets, supplements and alternative interventions. However, even with all of her professional training as a veterinary surgeon, she found it hard to determine fact from fiction.

There are so many diets, supplements, books and web pages of information and advice. There are equally as many people, with good intentions, offering their opinions of what works and what doesn't. In addition to this, there are amazing label claims, persuasive advertising and tonnes of supposed supporting evidence of efficacy.
